# MIND

A QUARTERLY REVIEW

OF

PSYCHOLOGY AND PHILOSOPHY

## I.—COMPUTING MACHINERY AND INTELLIGENCE

BY A. M. TURING

### 1. *The Imitation Game.*

I PROPOSE to consider the question, 'Can machines think?' This should begin with definitions of the meaning of the terms 'machine' and 'think'. The definitions might be framed so as to

*Many people think that a very abstract activity, like the playing of chess, would be best. It can also be maintained that it is best to provide the machine with the best **sense organs** that money can buy, and then teach it to understand and speak English. This process could follow the normal **teaching of a child**. Things would be pointed out and named, etc. Again I do not know what the right answer is, but I think both approaches should be tried.*

*1956*

# Birth of AI

1956: John McCarthy organized workshop at Dartmouth College

*Every aspect of learning or any other feature of intelligence can be so precisely described that a machine can be made to simulate it.*

**general principles**

# Birth of AI, early successes

**Checkers (1952):** Samuel's program learned weights and played at strong amateur level

**Problem solving (1955):** Newell & Simon's Logic Theorist: prove theorems in Principia Mathematica using search + heuristics; later, General Problem Solver (GPS)

# Overwhelming optimism...

*Machines will be capable, within twenty years, of doing any work a man can do.*

—Herbert Simon

*Within 10 years the problems of artificial intelligence will be substantially solved.*

—Marvin Minsky

*I visualize a time when we will be to robots what dogs are to humans, and I'm rooting for the machines.*

—Claude Shannon

# ...underwhelming results

Example: machine translation

*The spirit is willing but the flesh is weak.*

(Russian)

*The vodka is good but the meat is rotten.*

1966: ALPAC report cut off government funding for MT, first AI winter

# Implications of early era

## Problems:

- **Limited computation:** search space grew exponentially, outpacing hardware
- **Limited information:** complexity of AI problems (number of words, objects, concepts in the world)

## Useful contributions (John McCarthy):

- Lisp
- Garbage collection
- Time-sharing

# Knowledge-based systems (70-80s)

**Expert systems:** elicit specific domain knowledge from experts in form of rules:

if [premises] then [conclusion]

# Knowledge-based systems (70-80s)

DENDRAL: infer molecular structure from mass spectrometry

MYCIN: diagnose blood infections, recommend antibiotics

XCON: convert customer orders into parts specification

# Knowledge-based systems

## Wins:

- Knowledge helped both the **information** and **computation** gap
- First **real application** that impacted industry **Problems:**
- Deterministic rules couldn't handle the **uncertainty** of the real world
- Rules quickly became too **complex** to create and maintain

*A number of people have suggested to me that large programs like the SHRDLU program for understanding natural language represent a kind of **dead end** in AI programming. **Complex interactions** between its components give the program much of its power, but at the same time they present a formidable obstacle to understanding and extending it. In order to grasp any part, it is necessary to understand how it fits with other parts, presents a dense mass, with **no easy footholds**. Even having written the program, I find it near the limit of what I can keep in mind at once. — Terry Winograd*

1987: Collapse of Lisp machines and second AI winter

*1943*

# Artificial neural networks

1943: artificial neural networks, relate neural circuitry and mathematical logic (Mc- Culloch/Pitts)

1949: "cells that fire together wire together" learning rule (Hebb)

1958: Perceptron algorithm for linear classifiers (Rosenblatt)

1959: ADALINE device for linear regression (Widrow/Hoff)

1969: Perceptrons book showed that linear models could not solve XOR, killed neural nets research (Minsky/Papert)

# Revival of connectionism

1980: Neocognitron, a.k.a. convolutional neural networks for images (Fukushima)

1986: popularization of backpropagation for training multi-layer networks (Rumelhardt, Hinton, Williams)

1989: applied convolutional neural networks to recognizing handwritten digits for USPS (LeCun)

# Deep learning

2006: unsupervised layerwise pre-training of deep networks (Hinton et al.)

2012: AlexNet obtains huge gains in object recognition; transformed computer vision community overnight

2016: AlphaGo uses deep reinforcement learning, defeat world champion Lee Sedol in Go

# Two intellectual traditions

symbolic AI

neural AI

Food for thought: deep philosophical differences, but deeper connections  
(McCulloch/Pitts, AlphaGo)?

*1801*

# Early ideas from outside AI

1801: linear regression (Gauss, Legendre)

1936: linear classification (Fisher)

1956: Uniform cost search for shortest paths (Dijkstra)

1957: Markov decision processes (Bellman)

# Statistical machine learning

1985: Bayesian networks (Pearl)

1995: Support vector machines (Cortes/Vapnik)

# Three intellectual traditions

symbolic AI

neural AI

statistical AI

# Roadmap

AI history

**Ethics and responsibility**

Course content

# Why care about responsibility?

Isn't technology value-neutral?

Wernher von Braun

*"Once the rockets are up,  
Who cares where they come  
down? That's not my  
department,"*

*Says Wernher von Braun.*

Lyrics: Tom Lehrer

# Goal of responsibility

**Goal:** ensure AI is developed to benefit and not harm society

**High-level principles:** respect for persons, don't do harm

## ACM Code of Ethics and Professional Conduct

### ACM Code of Ethics and Professional Conduct

#### Preamble

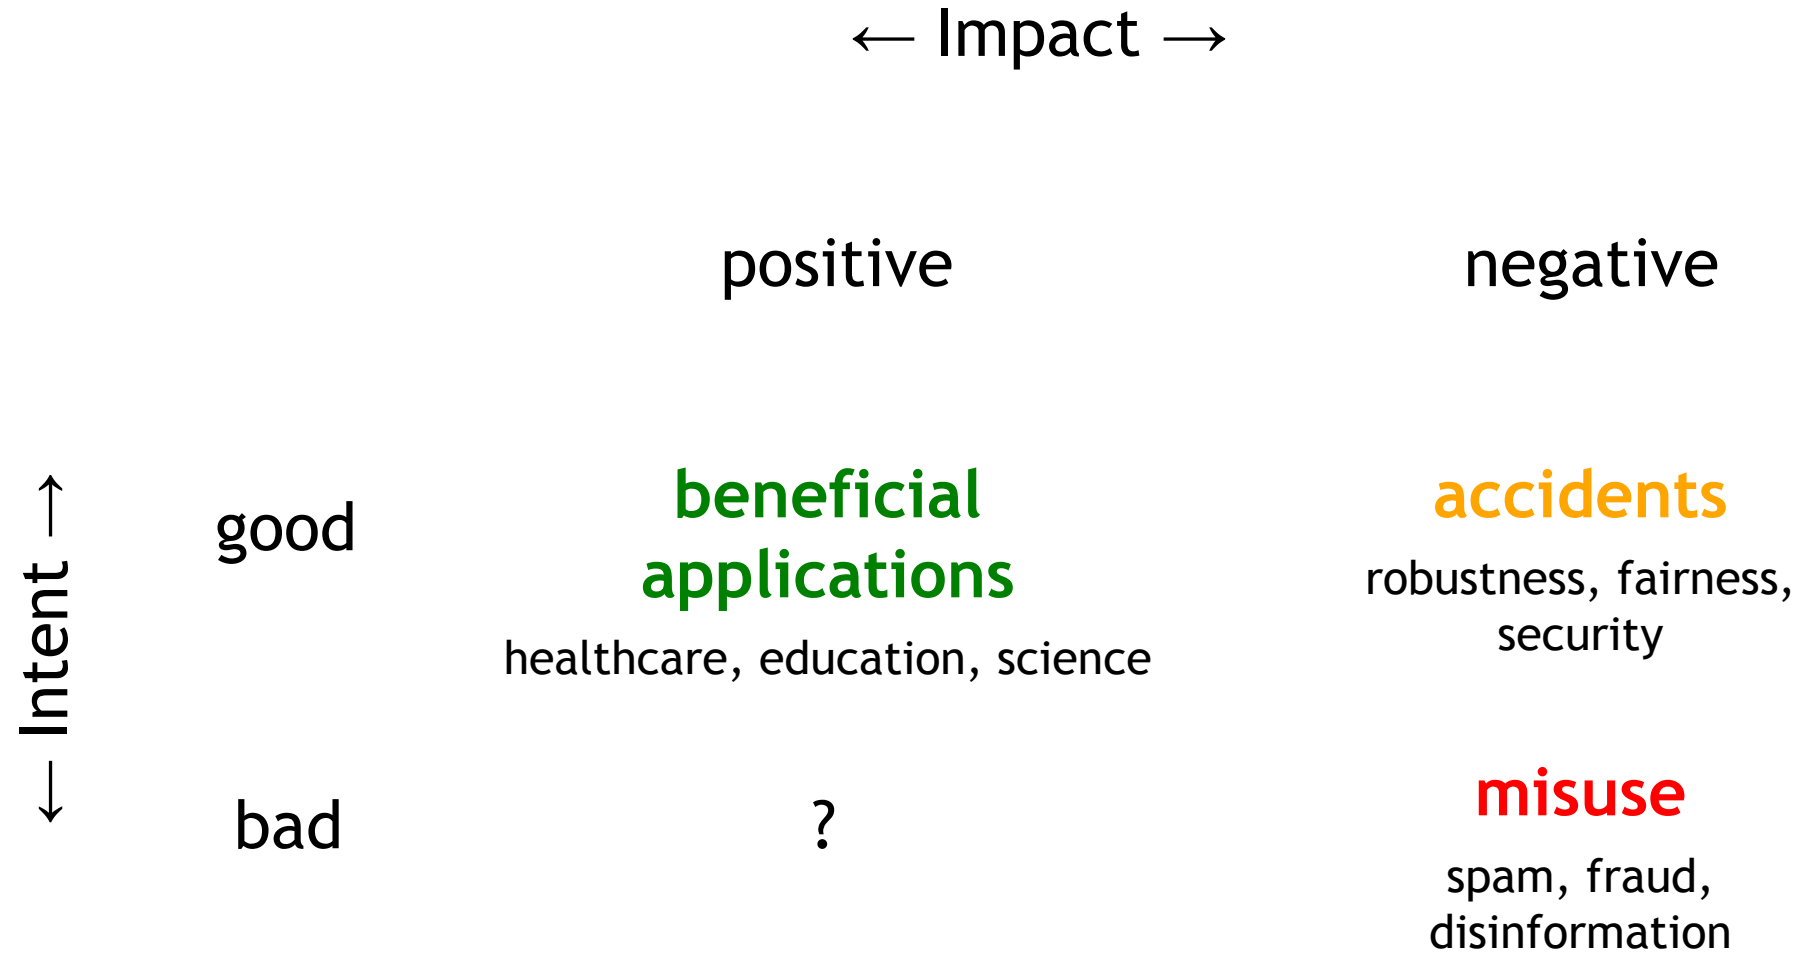

Computing professionals' actions change the world. To act responsibly, they should reflect upon the wider impacts of their work, consistently supporting the public good. The ACM Code of Ethics and Professional Conduct ("the Code") expresses the conscience of the profession.

## Microsoft AI principles

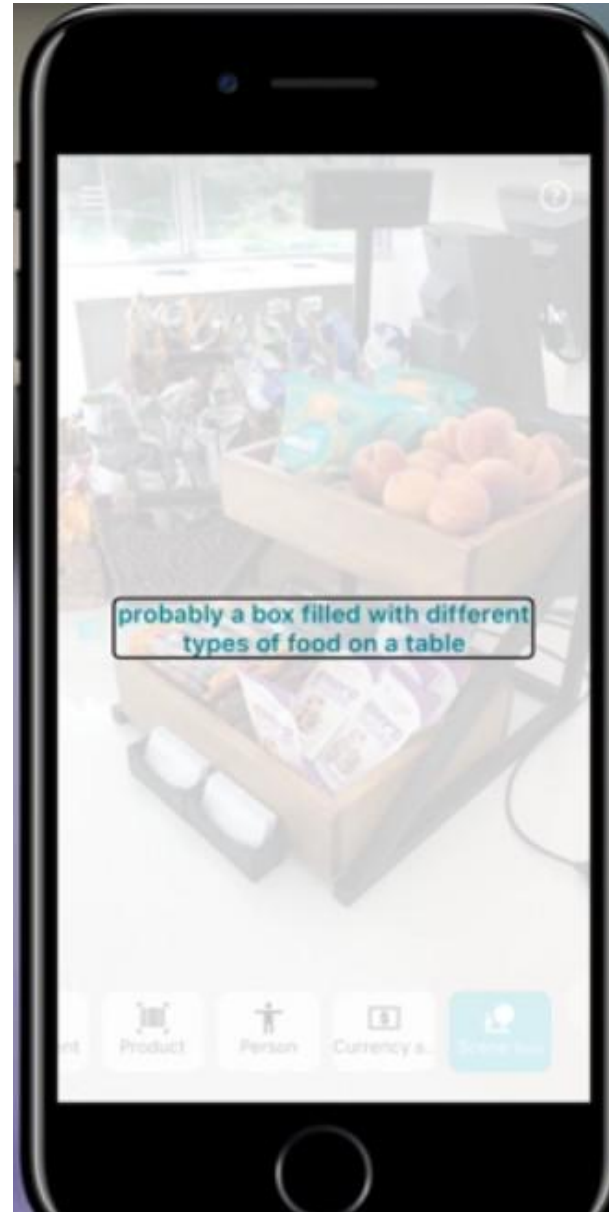

We put our responsible AI principles into practice through the Office of Responsible AI (ORA), the AI, Ethics, and Effects in Engineering and Research (Aether) Committee, and Responsible AI Strategy in Engineering (RAISE). The Aether Committee advises our leadership on the challenges and opportunities presented by AI innovations. ORA sets our rules and governance processes, working closely with teams across the company to enable the effort. RAISE is a team that enables the implementation of Microsoft responsible AI rules across engineering groups.

**Key question:** how to operationalize these principles?

# Intent versus impact

# Visual assistive technology

# Disinformation

**Others:** spam, fraud, personal attacks

# Dual-use technology

Definition: a dual use technology is one that can be used both to **benefit** and to **harm**.

Examples:

rockets

nuclear power

gene editing

social networks

AI

# Levels of abstraction

deep learning

image generation

deepfakes

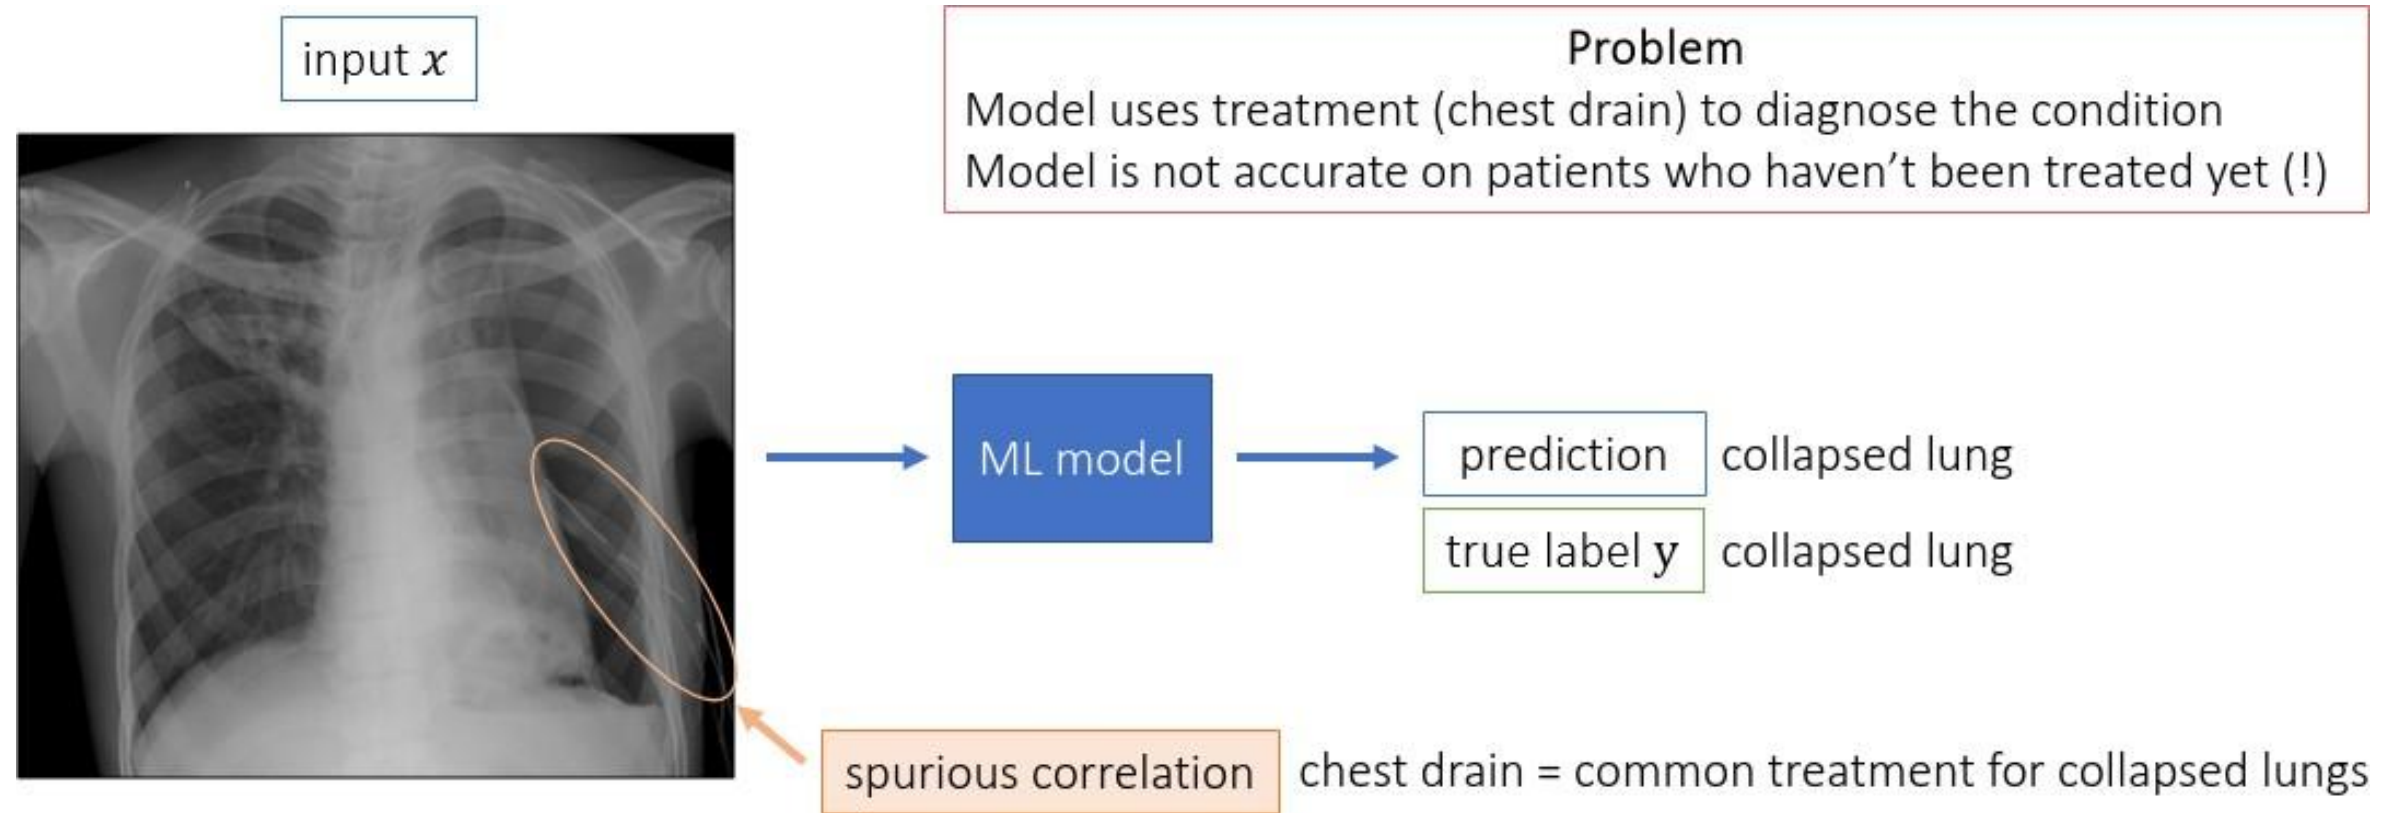

autonomous weapons

generality

specificity

# Robustness: spurious correlations

# Security

[Evtimov+ 2017]

[Sharif+ 2016]

Adversaries at test time!

# Data

- Web-scraped data can contain offensive content, historical biases

**MIT takes down 80 Million Tiny Images data set due to racist and offensive content**

- Consent: Should a datum (e.g. a picture of my dog) whose owner or creator intended it for one use be allowed to be used in another application (e.g. scene classification) without permission?

# Data

How to  
Stop Silicon Valley  
from Building a  
New Global Underclass

**GHOST**

Mary L. Gray and Siddharth Suri

**WORK**

Data is produced by human labor

# Transparency
